Docket No. 12217-100

METHOD AND APPARATUS FOR EVENT DRIVEN PROCESSING OF DATA

ABSTRACT of The Disclosure

A data processing system that enables event modules to

transmit event data to a module capable of processing the

event data, generating a response, and when required producing

a response profile to be sent to a location. The response is

5   produced by the system executing one or more scripts to

perform processing and gather data from processing modules.

As the response is being generated by the execution of the

script, the scripts self-modify based upon the data gathered.

The system recognizes the necessary changes and dynamically

10   generates a response to the changes. If the response profile

must be transmitted to another location, the response profile

will be in a format that the receiving location will

recognize.
